Extended Abstract

Introduction: Breast cancer is uncontrolled growth of abnormal cells that occur in different areas of the breast. This might happened in different kinds of tissue such as ducts that convey milk, milk producing tissue or non-glandular tissue. The incidence of various types of cancer varies among different populations and is in connection with factors such as occupation, society, culture, race (possibly hereditary), geography and nutrition. Research in the field of breast disease is very broad because the disease mostly affects the women who are the main hub of the family and improvement in quality of their life is equal to improvement of the quality of the community which they are involved.

Each year there are quite a number of breast cancer patients who die. According to study of glocoban which was conducted by the International Agency for Research on Cancer
